Method and Device for Comparing the Properties of Products

Abstract

The invention relates to a device and a method for checking properties of wares and services. Thus, one can speak of a product checker. Standardized properties of wares and services are stored in a first database, wherein the wares and services are provided with a unique product identification. Furthermore, there is a second database in which exclusion and desired criteria for wares and services for at least one user each are stored, access to the criteria being given by a unique user identification. With aid of a device which determines the product identification, the product properties are preferably retrieved on-line and compared with the criteria of the user. The comparison can be done on-line on a central server or on a hand-reading device which the user carries with him. The user is advised optically or acoustically of the result.
